

What is claimed is:

1. An ultrasonic wave utilizing device comprising:

a cylindrical elastic holder into which an ultrasonic sensor is pressed; and

5 a cylindrical part that is closed at one end and is formed in a case in such a way as to have the elastic holder assembled therein, characterized in that

the elastic holder has an elastic end wall formed at an end of pressing side and a first elastic retaining part for  
10 retaining an outside end edge of the ultrasonic sensor which is pressed into the elastic holder.

2. The ultrasonic wave utilizing device as claimed in claim 1, wherein the elastic holder has a second elastic retaining part retained by the case on the elastic end wall.

15 3. The ultrasonic wave utilizing device as claimed in claim 2, wherein the second elastic retaining part has an elastic pillar-shaped part that is passed through a hole formed in a bottom of the cylindrical part and an elastic bulging part that is formed on the elastic pillar-shaped part in a manner bulging  
20 in a radial direction such that it is passed through the hole and then retained by an edge of the hole.
